Trans. of [Société Chimique de France. Bulletin, 1960
[no. 2] p. 313-321.

The physicochemical study of sodium aluminate solu-
tions of molecular caustic ratio at any level greater
than one, by light diffusion, Raman spectrophotometry,
and translation diffusion militates in favor of a unique
aluminate ion, Al(OH)_4^- . A consequence of this fact is
the possibility of a thermodynamic study of the Bayer
phenomenon as represented by the reaction:
 $2\text{Al(OH)}_3 + [\text{Al(OH)}_4]^- \rightleftharpoons (n+1) \text{Al(OH)}_3 + \text{OH}^-$
Furthermore, it is shown that the separation of crys-
talline trihydrate cannot be spontaneous. This excludes
the macromolecular or macro-ionic intermediate.
